The deadly collapse of a three-story apartment building in Brooklyn, New York, was caused by "unsafe construction operations at the adjacent property," the New York City Department of Buildings posted on its website Nov. 12 as hundreds of emergency workers continued to comb through the rubble for survivors.

At least eight people died and 17 others were injured, including three firefighters, New York City Mayor Zohran Mamdani said on social media the morning of Nov. 12.

The structure, described by Reuters as a four-unit apartment building dating to 1930, collapsed into an adjacent construction site at about 4 p.m. ET on Nov. 11, trapping residents and construction workers beneath the debris. More than 250 firefighters and EMS personnel responded within a minute and began searching the wreckage for survivors.

Rescue personnel operated overnight under "extremely dangerous conditions to find and save anyone who may still be trapped," and work continued on Nov. 12, Mamdani said, advising the public to "please stay clear of the area." A full vacate order was issued for the building.

Five patients were determined to be dead on arrival, the New York City Fire Department confirmed to USA TODAY at 6:30 a.m. ET on Nov. 12. Of those who were injured, four were hospitalized in critical condition, five had serious but non-life-threatening injuries and 10 had minor injuries, officials said.

About an hour later, Mamdani announced the death toll had risen to eight.

"There are no words for a loss of this magnitude," Mamdani wrote. "My heart is with the families and loved

Officials: ICE detention plan wasted millions

The Department of Homeland Security planned an immigration detention "mega center" in Social Circle, Georgia. The proposal later was abandoned.

SOCIAL CIRCLE, GA – When federal officials revealed plans for a 10,000-bed immigration detention center in this tiny Trump-loving community, locals had a lot of questions. Among them: How, exactly, are you planning to flush the toilets?

Envisioned as a core part of a network of Amazon-like warehouse "mega centers" housing migrants facing deportation, the building sits at the corner of an industrial park fewer than 50 miles east of downtown Atlanta and is large enough to fit 17 football fields. The project would have dwarfed the more than 200 migrant detention facilities operating nationwide today.

Social Circle officials said the Department of Homeland Security lacked the kinds of detailed plans necessary to move the project forward, including access to wastewater treatment for thousands of detainees

ABOUT THE SERIES

This is the second article in a four-part series for which the USA TODAY Network spent months assessing the Trump administration's expansion of immigration enforcement, digging into its plans for more detention space, the conditions inside and the background of one of its key contractors. Our journalists reported in communities across the nation, sifting through public records and interviewing people on all sides of the debate.

AI helping cybercriminals net personal info

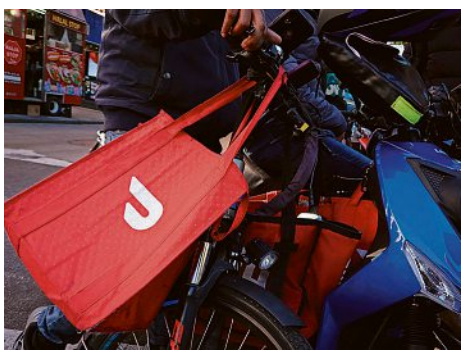

Tech-assisted malware swipes food delivery, online shopping data

Greta Reich
USA TODAY

Artificial intelligence is advancing cybercriminals' ability to gather and analyze personal information from food delivery orders and online shopping receipts, according to research released this month by Cisco Talos.

The Windows-based malware called "VOLTA-AUTODOXER" is augmented by a large language model that sorts through passwords, payment cards, wi-fi profiles and conversations on Discord, Telegram and Roblox and builds a victim profile that can include geolocation, home address, employer and inferred birth year.

Ryan Fetterman, a security and threat researcher at Cisco's threat intelligence group Talos, said the technological capability "feels like a 'Black Mirror' episode."

"VOLTA-AUTODOXER" malware can run queries against your inbox to access information such as DoorDash receipts or Amazon Prime deliveries.

"The distinguishing factor for me is that level of AI integration that maybe makes this more effective to deploy at scale," Fetterman told USA TODAY.

He discovered the malware in October while studying the progression of malware samples that integrate AI. Online scams have been on the rise this year, increasing by 41.1% in the past year as cybercriminals increasingly target employees with personalized scams, according to a 2026 Phishing-Threat Trends Report. Fetterman said this is the first time AI has been used to augment malware in this way.

VOLTA is a "stealer malware," meaning it is a type of discrete software designed to extract sensitive data from an infected Windows device without the user's knowledge. It primarily targets the browser and email providers such as Outlook and Thunderbird, looking for stored credentials.

"It does a pretty wide pass on like this initial set of secrets that it can collect from you" Fetterman said, before it does a second pass to leverage access to authentication tokens, which are digital credentials it can use to pretend to be an individual to gain access to accounts.

"If it has your Gmail token, it can run queries against your Gmail inbox to pull
